CC: Bender, Emily [Bender.Emily@epa.gov]
Subject: RE: News: Midterm Evaluation

Maggie – connecting you with Emily Bender in Region 1 – to talk with her about what you are learning about cision alerts. Also, Emily would like to sit in on our meeting with Cision next week – via phone – so can you send her the scheduler.

Also, have you connected with Dave Bryan in region 7 re: cision analytics? Region 1 is meeting with cision on that topic next week, so hopefully we could join in via phone for that.

Thanks ng

Nancy Grantham

Subject: FW: News: Midterm Evaluation

Hi – here's the midterm evaluation clips from last night to this morning. I'm seeing a few duplicates so I'll make note that we should ask Sarah about that when she's here on the 10th.

shenell's twin sister, officer shontrell johnson, already a member of the new orleans police department, a recruit class just like this one, still a memory pretty fresh in her mind. >> just being a part of the community and doing that i love it. i love the job and i am going to be happy when she gets out of the academy and she'll be able to see all the things that i see. reporter: shontrell says her mentor was officer daryle holloway, killed in the line of duty in june of 2015, now as this new group of

recruits begins training, she steps up to mentor her twin, six minutes younger. >> i said if he can do it, i can do it. even though he's not here today, he always pushed me through when i was around him. >> challenges they give me, i will never give up. challenges are my thing. reporter and it will be a : challenge, 32 new recruits going through intense physical and emotional training, gearing up to deal with the often dangerous streets of new portland. -- n orleans. >> we believe in god too and we know that god is going to keep us safe no matter where we are. reporter it's a picture of : community service painted by officer johnson, inspiring recruit johnson, and a group of recruits now depending on each other to make to graduation, it's means a lot to them, and to some, it means twice as much. heath allen wdsu news. sula: environmental protection agency administrator scott pruit says the obama-era car and truck emission standards should be revised. today marked the end of the midterm evaluation process for green house gas emissions for cars produced from 2022 through 2025 good following the evaluation, pruit announced current emissions standards are too high, calling them rushed and unrealistic. they were passed at the end of obama's second term. pruit also said the epa will work with individual states on the new standards. shaun: all over the world allergies and asthma cases are on the rise. but a new study suggests some medications may be behind the rise of allergies and asthma. according to journal jama pediatrics babies who take acid-suppressive meds and antibiotics are more likely to develop allergic diseases later in life. dosage also plays a role. researchers say babies who took certain medications for more than 60 days had a 52% greater risk of being diagnosed with a food allergy. researchers urge doctors to be mindful of over-prescribing but say more research is needed to confirm a direct link. still ahead, 13-year-old trapped in a sewer in california finally sees the light after 13 hours, the length authorities went to, to bring him home safely . and a 17-year-old's reaction to getting a college acceptance letter goes viral. but it isn't his first celebration.

for childhood arrivals is dead...and he's pinning the blame squarely on democrats and mexico. angelica alvarez has details from the white house. president trump watched as kids rolled easter eggs over a finish line...but it was people crossing over the border that was on his mind. "people are taking advantage of daca and that's a shame. it should have never happened." and the president blamed democrats for failing to protect daca recipients...the so-called "dreamers" w were brought to america illegally as children. "the democrat have really let them down, it's a shame." he tweeted this morning: "dac is dead because the democrats didn't care or act." "mus build wall and secure our borders with proper border legislation." but during the recent budget battle on capitol hill - democrats say it was the president who turned down a deal to fully fund his border wall in exchange for daca protections. virginia/march 23, 2018 "we gave hi every penny he asked for over ten years, and fixed the dreamer problem and he said no." congress gave the president only one-point- six billion dollars for his border wall instead of the 25 billion he requested. so now he's focusing on mexico to stop immigration. "mexico has got to help us at the border. they flow right through mexico. they send them into the united states. can't happen that way anymore." the president claimed "caravans" o undocumented immigrants are coming into the u-s through mexico. "we do come over but we have done more good than bad." the president says he will end nafta...the north american free trade agreement between the u- s, mexico and canada...if mexico doesn't do more to stop illegal immigration. angelica alvarez, cbs news, the white house. the trump administration is asking the supreme court to declare a digital privacy case involving microsoft as moot due to a new law. the case concerns microsoft refusing to give up information from a data center in ireland to government authorities conducting a drug investigation back in 20-14. the government wanted access to emails from microsoft's email service for its probe, but the company argued the law did not cover that. the trump administration argues the "cloud act" passed b congress earlier this month clearly stipulates that such data should be turned over the the government and there is no longer a need for the case. environmental protection agency administrator scott pruit announced today that obama-era car and truck emission standards should be revised. today marked the end of the midterm evaluation process for green house gas emissions for cars produced from 20-22 through 20-25. following the evaluation, pruit announced current emissions standards are too high, calling them rushed and unrealistic. they were passed at the end of president obama's second term. pruit also said the e-p-a will work with individual states on the new standards. what a difference a

enough bodies to meet the demand of workers we need. "work force shortage is playing itself out is we don't have time for people to go to 4 or 6 years of college.. we need people right now" to combat this, the state has started a variety programs to help individuals increase training and build employment skills. they've found particular success with the montana registered apprenticeship program where young people can learn a variety of skills ranging from flobotomy to childcare. luckily, montana's economy is still strong with a four point one percent unemployment rate, so there are jobs out there for people who want them. now to a story out of helena.. where we're learning new information in the double murder investigation of a couple. we're learning the person of interest in that investigation.. has just been cleared. the clark county sheriff has released a statement--stating andrew duncan is no longer a person of tere. last month.. authorities said they wanted to talk to duncan about the double murder of an elderly couple in helena valley.. and about the burglary of the couple business. he was arrested last sunday on other chars not related to the murder. two weeks ago authorities arrested the couple's adopted son.. 21-year-old kaleb taylor, for his connection to the crimes. they also arrested 22- year-old journ wienke. david and charla taylor were found dead in their home last month by a family member. police say soon after the investigation began.. kaleb taylor admitted to the murders. friends of the victims say the taylors recently confronted their son about the burglary. he also has a prior conviction for burglarizing his parent's home. we will continue to follow this investigation.. and bring you any new developments as we learn them. and in national news.. environmental protection agency administrator scott pruit announced today that obama-era car and truck emission standards should be revised. today marked the end of the midterm evaluation process for green house gas emissions for cars produced from 20-22 through 20-25. following the evaulation, pruit announced current emissions standards are too high, calling them rushed and unrealistic. they were

passed at the end of obama's second term. pruit also said the e-p-a will also work with individual states on the new standards, including california, which has stricter requirements than other states. find out why the cats defensive line could be on the prowl this season... us she's sharp between the lines and even sharper between the ears... meet great falls' very own tennis star and scholar coming up in sports... as we first brought to you this morning on wake up montana.... unlike any other time in history-- parents today face constant challenges when it comes to social media, texting and video games for their kids. david kaplan joins us with strategies created by high school parents.. they say can help. parents and teachers i spoke with here at red lodge high school say, they've been talking about several strategies to remove the phones from young people, so we don't have what is called, "screenagers". vo- after watching the film

EPA to roll back Obama-era car fuel, emissions standards | [View Clip](#)**04/02/2018*****Orlando Sentinel Online***

Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring cars and light trucks sold in the United States to average more than 50 miles per gallon by 2025, a move that could change the composition of the nation's auto fleet for years.

The push to rewrite the first-ever carbon limits on cars and SUVs, which came out of an agreement among federal officials, automakers and the state of California, is sure to spark a major political and legal battle.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if its waiver is revoked and it is blocked from imposing stricter targets. Such a fight has broad implications because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Donald Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety Administration would establish a standard that "allows auto manufacturers to make cars that people both want and can afford - while still expanding environmental and safety benefits of newer cars." The agency said he is still considering the status of California's waiver.

Officials in that state immediately excoriated the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at the potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said. The EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage - those rules remain in place."

The efficiency gains that the U.S. auto fleet has made in recent decades have slowed since 2013, as gas prices dipped and the sale of pickup trucks and SUVs accelerated. In the document Pruitt signed Monday, he said EPA had been "optimistic in its assumptions and projections" about the availability of technology to meet the standards and had received substantial input from automakers that they needed to be scaled back.

He suggested that if cleaner vehicles are too expensive, consumers will hold onto older cars, thereby lowering the overall efficiency of cars on the road.

Peter Welch, president and chief executive of the National Automobile Dealers Association, said in a statement Monday that while the group supports "continuous improvements" in reducing vehicle emissions, "Standards alone - whatever they are - won't do the trick."

The Alliance of Automobile Manufacturers, whose members produce 70 percent of the cars and light trucks sold in the United States, endorsed the shift. The group estimates that it would be more realistic to require the fleet to reach a miles-per-gallon target in the high 40s by 2025.

The U.S. fleet averaged 31.8 mpg for model year 2017, according to federal figures.

Alliance spokeswoman Gloria Bergquist said in an email that her members "support the administration for pursuing a data-

driven effort and a single national program as it works to finalize future standards. We appreciate that the administration is working to find a way to both increase fuel economy standards and keep new vehicles affordable to more Americans."

But two of those members, Ford and Honda, recently urged the government to maintain the current requirements but give manufacturers additional flexibility.

At the Safe Climate Campaign, Director Dan Becker projected that retaining the Obama rule would cut carbon dioxide emissions by 6 billion tons and save 12 billion barrels of oil over the lifetime of vehicles complying with these standards.

"Even though automakers are pushing gas-guzzling pickups and SUVs rather than more efficient cars, it's still the biggest step any nation has ever taken to cut global warming pollution and save oil," he said.

Two of Pruitt's predecessors were harshly critical.

"All they care about is undoing everything the prior administration did, and they'll use any excuse for doing that. They don't even have the industry itself asking for this," said Gina McCarthy, EPA administrator under President Barack Obama and now director of Harvard's Center for Health and the Global Environment.

McCarthy said that the standards set during the Obama era were based on extensive negotiations with states and the federal government, as well as with the auto industry.

"The decision I made was based on real information," while Pruitt's decision seemed to have no factual basis, she said.

And former EPA administrator Carol M. Browner, who helped forge the initial carbon thresholds for cars and light trucks in 2009 while serving in the Obama White House, took issue with Pruitt's allegation that officials in California are somehow at fault, saying "this idea that California is dictating or arbitrating for the rest of the country is not accurate."

Rather, Browner said, federal and state officials in past administrations worked hard to reach a compromise that gave certainty to automakers while moving the nation to embrace more fuel-efficient vehicles.

"There's an opportunity for us to lead the global market in cleaner, more efficient cars," she said. "But [Trump officials] are simply going to walk away from that opportunity."

EPA to roll back Obama-era car fuel, emissions standards | [View Clip](#)

04/02/2018

Orlando Sentinel Online

Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring cars and light trucks sold in the United States to average more than 50 miles per gallon by 2025, a move that could change the composition of the nation's auto fleet for years.

The push to rewrite the first-ever carbon limits on cars and SUVs, which came out of an agreement among federal officials, automakers and the state of California, is sure to spark a major political and legal battle.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if its waiver is revoked and it is blocked from imposing stricter targets. Such a fight has broad implications because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Donald Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety Administration would establish a standard that "allows auto manufacturers to make cars that people both want and can afford - while still expanding environmental and safety benefits of newer cars." The agency said he is still considering the status of California's waiver.

Officials in that state immediately excoriated the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at the potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said. The EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage - those rules remain in place."

The efficiency gains that the U.S. auto fleet has made in recent decades have slowed since 2013, as gas prices dipped and the sale of pickup trucks and SUVs accelerated. In the document Pruitt signed Monday, he said EPA had been "optimistic in its assumptions and projections" about the availability of technology to meet the standards and had received substantial input from automakers that they needed to be scaled back.

He suggested that if cleaner vehicles are too expensive, consumers will hold onto older cars, thereby lowering the overall efficiency of cars on the road.

Peter Welch, president and chief executive of the National Automobile Dealers Association, said in a statement Monday that

while the group supports "continuous improvements" in reducing vehicle emissions, "Standards alone - whatever they are - won't do the trick."

The Alliance of Automobile Manufacturers, whose members produce 70 percent of the cars and light trucks sold in the United States, endorsed the shift. The group estimates that it would be more realistic to require the fleet to reach a miles-per-gallon target in the high 40s by 2025.

The U.S. fleet averaged 31.8 mpg for model year 2017, according to federal figures.

Alliance spokeswoman Gloria Bergquist said in an email that her members "support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards. We appreciate that the administration is working to find a way to both increase fuel economy standards and keep new vehicles affordable to more Americans."

But two of those members, Ford and Honda, recently urged the government to maintain the current requirements but give manufacturers additional flexibility.

At the Safe Climate Campaign, Director Dan Becker projected that retaining the Obama rule would cut carbon dioxide emissions by 6 billion tons and save 12 billion barrels of oil over the lifetime of vehicles complying with these standards.

"Even though automakers are pushing gas-guzzling pickups and SUVs rather than more efficient cars, it's still the biggest step any nation has ever taken to cut global warming pollution and save oil," he said.

Two of Pruitt's predecessors were harshly critical.

"All they care about is undoing everything the prior administration did, and they'll use any excuse for doing that. They don't even have the industry itself asking for this," said Gina McCarthy, EPA administrator under President Barack Obama and now director of Harvard's Center for Health and the Global Environment.

McCarthy said that the standards set during the Obama era were based on extensive negotiations with states and the federal government, as well as with the auto industry.

"The decision I made was based on real information," while Pruitt's decision seemed to have no factual basis, she said.

And former EPA administrator Carol M. Browner, who helped forge the initial carbon thresholds for cars and light trucks in 2009 while serving in the Obama White House, took issue with Pruitt's allegation that officials in California are somehow at fault, saying "this idea that California is dictating or arbitrating for the rest of the country is not accurate."

Rather, Browner said, federal and state officials in past administrations worked hard to reach a compromise that gave certainty to automakers while moving the nation to embrace more fuel-efficient vehicles.

"There's an opportunity for us to lead the global market in cleaner, more efficient cars," she said. "But [Trump officials] are simply going to walk away from that opportunity."

EPA to roll back car emissions standards

Juliet Eilperin and Brady Dennis, The Washington Post

April 2, 2018

WASHINGTON - Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring cars and light trucks sold in the United States to average more than 50 miles per gallon by 2025, a move that could change the composition of the nation's auto fleet for years.

The push to rewrite the first-ever carbon limits on cars and SUVs, which came out of an agreement among federal officials,

automakers and the state of California, is sure to spark a major political and legal battle.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if its waiver is revoked and it is blocked from imposing stricter targets. Such a fight has broad implications because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Donald Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety Administration would establish a standard that "allows auto manufacturers to make cars that people both want and can afford - while still expanding environmental and safety benefits of newer cars." The agency said he is still considering the status of California's waiver.

Officials in that state immediately excoriated the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at the potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said. The EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage - those rules remain in place."

EPA Administrator Scott Pruitt is revoking Obama-era standards requiring cars and light trucks to average more than 50 miles per gallon by 2025

Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring cars and light trucks sold in the United States to average more than 50 miles per gallon by 2025, a move that could change the composition of the nation's auto fleet for years.

The push to rewrite the first-ever carbon limits on cars and SUVs, which came out of an agreement among federal officials, automakers and the state of California, is sure to spark a major political and legal battle.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if its waiver is revoked and it is blocked from imposing stricter targets. Such a fight has broad implications because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Donald Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety Administration would establish a standard that "allows auto manufacturers to make cars that people both want and can afford - while still expanding environmental and safety benefits of newer cars." The agency said he is still considering the status of California's waiver.

Officials in that state immediately excoriated the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at the potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said. The EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage - those rules remain in place."

The efficiency gains that the U.S. auto fleet has made in recent decades have slowed since 2013, as gas prices dipped and the sale of pickup trucks and SUVs accelerated. In the document Pruitt signed Monday, he said EPA had been "optimistic in its assumptions and projections" about the availability of technology to meet the standards and had received substantial input from automakers that they needed to be scaled back.

He suggested that if cleaner vehicles are too expensive, consumers will hold onto older cars, thereby lowering the overall efficiency of cars on the road.

Peter Welch, president and chief executive of the National Automobile Dealers Association, said in a statement Monday that while the group supports "continuous improvements" in reducing vehicle emissions, "Standards alone - whatever they are - won't do the trick."

The Alliance of Automobile Manufacturers, whose members produce 70 percent of the cars and light trucks sold in the United States, endorsed the shift. The group estimates that it would be more realistic to require the fleet to reach a miles-per-gallon target in the high 40s by 2025.

The U.S. fleet averaged 31.8 mpg for model year 2017, according to federal figures.

Alliance spokeswoman Gloria Bergquist said in an email that her members "support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards. We appreciate that the administration is working to find a way to both increase fuel economy standards and keep new vehicles affordable to more Americans."

But two of those members, Ford and Honda, recently urged the government to maintain the current requirements but give manufacturers additional flexibility.

At the Safe Climate Campaign, Director Dan Becker projected that retaining the Obama rule would cut carbon dioxide emissions by 6 billion tons and save 12 billion barrels of oil over the lifetime of vehicles complying with these standards.

"Even though automakers are pushing gas-guzzling pickups and SUVs rather than more efficient cars, it's still the biggest step any nation has ever taken to cut global warming pollution and save oil," he said.

Two of Pruitt's predecessors were harshly critical.

"All they care about is undoing everything the prior administration did, and they'll use any excuse for doing that. They don't even have the industry itself asking for this," said Gina McCarthy, EPA administrator under President Barack Obama and now director of Harvard's Center for Health and the Global Environment.

McCarthy said that the standards set during the Obama era were based on extensive negotiations with states and the federal government, as well as with the auto industry.

"The decision I made was based on real information," while Pruitt's decision seemed to have no factual basis, she said.

And former EPA administrator Carol M. Browner, who helped forge the initial carbon thresholds for cars and light trucks in 2009 while serving in the Obama White House, took issue with Pruitt's allegation that officials in California are somehow at fault, saying "this idea that California is dictating or arbitrating for the rest of the country is not accurate."

Rather, Browner said, federal and state officials in past administrations worked hard to reach a compromise that gave certainty to automakers while moving the nation to embrace more fuel-efficient vehicles.

"There's an opportunity for us to lead the global market in cleaner, more efficient cars," she said. "But [Trump officials] are simply going to walk away from that opportunity."

"The decision I made was based on real information," while Pruitt's decision seemed to have no factual basis, she said.

And former EPA administrator Carol M. Browner, who helped forge the initial carbon thresholds for cars and light trucks in 2009 while serving in the Obama White House, took issue with Pruitt's allegation that officials in California are somehow at fault, saying "this idea that California is dictating or arbitrating for the rest of the country is not accurate."

Rather, Browner said, federal and state officials in past administrations worked hard to reach a compromise that gave certainty to automakers while moving the nation to embrace more fuel-efficient vehicles.

"There's an opportunity for us to lead the global market in cleaner, more efficient cars," she said. "But [Trump officials] are simply going to walk away from that opportunity."

Baltimore Sun Online, The

Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring cars and light trucks sold in the United States to average more than 50 miles per gallon by 2025, a move that could change the composition of the nation's auto fleet for years.

The push to rewrite the first-ever carbon limits on cars and SUVs, which came out of an agreement among federal officials, automakers and the state of California, is sure to spark a major political and legal battle.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if its waiver is revoked and it is blocked from imposing stricter targets. Such a fight has broad implications because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Donald Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety Administration would establish a standard that "allows auto manufacturers to make cars that people both want and can afford - while still expanding environmental and safety benefits of newer cars." The agency said he is still considering the status of California's waiver.

Officials in that state immediately excoriated the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at the potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said. The EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage - those rules remain in place."

The efficiency gains that the U.S. auto fleet has made in recent decades have slowed since 2013, as gas prices dipped and the sale of pickup trucks and SUVs accelerated. In the document Pruitt signed Monday, he said EPA had been "optimistic in its assumptions and projections" about the availability of technology to meet the standards and had received substantial input from automakers that they needed to be scaled back.

He suggested that if cleaner vehicles are too expensive, consumers will hold onto older cars, thereby lowering the overall efficiency of cars on the road.

Peter Welch, president and chief executive of the National Automobile Dealers Association, said in a statement Monday that while the group supports "continuous improvements" in reducing vehicle emissions, "Standards alone - whatever they are - won't do the trick."

The Alliance of Automobile Manufacturers, whose members produce 70 percent of the cars and light trucks sold in the United States, endorsed the shift. The group estimates that it would be more realistic to require the fleet to reach a miles-per-gallon target in the high 40s by 2025.

The U.S. fleet averaged 31.8 mpg for model year 2017, according to federal figures.

Alliance spokeswoman Gloria Bergquist said in an email that her members "support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards. We appreciate that the administration is working to find a way to both increase fuel economy standards and keep new vehicles affordable to more Americans."

But two of those members, Ford and Honda, recently urged the government to maintain the current requirements but give manufacturers additional flexibility.

At the Safe Climate Campaign, Director Dan Becker projected that retaining the Obama rule would cut carbon dioxide emissions by 6 billion tons and save 12 billion barrels of oil over the lifetime of vehicles complying with these standards.

"Even though automakers are pushing gas-guzzling pickups and SUVs rather than more efficient cars, it's still the biggest step any nation has ever taken to cut global warming pollution and save oil," he said.

Two of Pruitt's predecessors were harshly critical.

"All they care about is undoing everything the prior administration did, and they'll use any excuse for doing that. They don't even have the industry itself asking for this," said Gina McCarthy, EPA administrator under President Barack Obama and now director of Harvard's Center for Health and the Global Environment.

McCarthy said that the standards set during the Obama era were based on extensive negotiations with states and the federal government, as well as with the auto industry.

"The decision I made was based on real information," while Pruitt's decision seemed to have no factual basis, she said.

And former EPA administrator Carol M. Browner, who helped forge the initial carbon thresholds for cars and light trucks in 2009 while serving in the Obama White House, took issue with Pruitt's allegation that officials in California are somehow at fault, saying "this idea that California is dictating or arbitrating for the rest of the country is not accurate."

Rather, Browner said, federal and state officials in past administrations worked hard to reach a compromise that gave certainty to automakers while moving the nation to embrace more fuel-efficient vehicles.

"There's an opportunity for us to lead the global market in cleaner, more efficient cars," she said. "But [Trump officials] are simply going to walk away from that opportunity."

Morning Call Online, The

EPA Administrator Scott Pruitt is revoking Obama-era standards requiring cars and light trucks to average more than 50 miles per gallon by 2025

Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring cars and light trucks sold in the United States to average more than 50 miles per gallon by 2025, a move that could change the composition of the nation's auto fleet for years.

The push to rewrite the first-ever carbon limits on cars and SUVs, which came out of an agreement among federal officials, automakers and the state of California, is sure to spark a major political and legal battle.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if its waiver is revoked and it is blocked from imposing stricter targets. Such a fight has broad implications because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Donald Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety Administration would establish a standard that "allows auto manufacturers to make cars that people both want and can afford - while still expanding environmental and safety benefits of newer cars." The agency said he is still considering the status of California's waiver.

Officials in that state immediately excoriated the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at the potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said. The EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage - those rules remain in place."

The efficiency gains that the U.S. auto fleet has made in recent decades have slowed since 2013, as gas prices dipped and the sale of pickup trucks and SUVs accelerated. In the document Pruitt signed Monday, he said EPA had been "optimistic in its assumptions and projections" about the availability of technology to meet the standards and had received substantial input from automakers that they needed to be scaled back.

He suggested that if cleaner vehicles are too expensive, consumers will hold onto older cars, thereby lowering the overall efficiency of cars on the road.

Peter Welch, president and chief executive of the National Automobile Dealers Association, said in a statement Monday that while the group supports "continuous improvements" in reducing vehicle emissions, "Standards alone - whatever they are - won't do the trick."

The Alliance of Automobile Manufacturers, whose members produce 70 percent of the cars and light trucks sold in the United States, endorsed the shift. The group estimates that it would be more realistic to require the fleet to reach a miles-per-gallon target in the high 40s by 2025.

The U.S. fleet averaged 31.8 mpg for model year 2017, according to federal figures.

Alliance spokeswoman Gloria Bergquist said in an email that her members "support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards. We appreciate that the administration is working to find a way to both increase fuel economy standards and keep new vehicles affordable to more Americans."

But two of those members, Ford and Honda, recently urged the government to maintain the current requirements but give manufacturers additional flexibility.

At the Safe Climate Campaign, Director Dan Becker projected that retaining the Obama rule would cut carbon dioxide emissions by 6 billion tons and save 12 billion barrels of oil over the lifetime of vehicles complying with these standards.

"Even though automakers are pushing gas-guzzling pickups and SUVs rather than more efficient cars, it's still the biggest step any nation has ever taken to cut global warming pollution and save oil," he said.

Two of Pruitt's predecessors were harshly critical.

"All they care about is undoing everything the prior administration did, and they'll use any excuse for doing that. They don't

even have the industry itself asking for this," said Gina McCarthy, EPA administrator under President Barack Obama and now director of Harvard's Center for Health and the Global Environment.

McCarthy said that the standards set during the Obama era were based on extensive negotiations with states and the federal government, as well as with the auto industry.

"The decision I made was based on real information," while Pruitt's decision seemed to have no factual basis, she said.

And former EPA administrator Carol M. Browner, who helped forge the initial carbon thresholds for cars and light trucks in 2009 while serving in the Obama White House, took issue with Pruitt's allegation that officials in California are somehow at fault, saying "this idea that California is dictating or arbitrating for the rest of the country is not accurate."

Rather, Browner said, federal and state officials in past administrations worked hard to reach a compromise that gave certainty to automakers while moving the nation to embrace more fuel-efficient vehicles.

"There's an opportunity for us to lead the global market in cleaner, more efficient cars," she said. "But [Trump officials] are simply going to walk away from that opportunity."

Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring cars and light trucks sold in the United States to average more than 50 miles per gallon by 2025, a move that could change the composition of the nation's auto fleet for years.

The push to rewrite the first-ever carbon limits on cars and SUVs, which came out of an agreement among federal officials, automakers and the state of California, is sure to spark a major political and legal battle.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if its waiver is revoked and it is blocked from imposing stricter targets. Such a fight has broad implications because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Donald Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety Administration would establish a standard that "allows auto manufacturers to make cars that people both want and can afford - while still expanding environmental and safety benefits of newer cars." The agency said he is still considering the status of California's waiver.

Officials in that state immediately excoriated the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at the potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said. The EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage - those rules remain in place."

The efficiency gains that the U.S. auto fleet has made in recent decades have slowed since 2013, as gas prices dipped and the sale of pickup trucks and SUVs accelerated. In the document Pruitt signed Monday, he said EPA had been "optimistic in its assumptions and projections" about the availability of technology to meet the standards and had received substantial input from automakers that they needed to be scaled back.

He suggested that if cleaner vehicles are too expensive, consumers will hold onto older cars, thereby lowering the overall efficiency of cars on the road.

Peter Welch, president and chief executive of the National Automobile Dealers Association, said in a statement Monday that while the group supports "continuous improvements" in reducing vehicle emissions, "Standards alone - whatever they are - won't do the trick."

The Alliance of Automobile Manufacturers, whose members produce 70 percent of the cars and light trucks sold in the United States, endorsed the shift. The group estimates that it would be more realistic to require the fleet to reach a miles-per-gallon target in the high 40s by 2025.

The U.S. fleet averaged 31.8 mpg for model year 2017, according to federal figures.

Alliance spokeswoman Gloria Bergquist said in an email that her members "support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards. We appreciate that the administration is working to find a way to both increase fuel economy standards and keep new vehicles affordable to more Americans."

But two of those members, Ford and Honda, recently urged the government to maintain the current requirements but give manufacturers additional flexibility.

At the Safe Climate Campaign, Director Dan Becker projected that retaining the Obama rule would cut carbon dioxide emissions by 6 billion tons and save 12 billion barrels of oil over the lifetime of vehicles complying with these standards.

"Even though automakers are pushing gas-guzzling pickups and SUVs rather than more efficient cars, it's still the biggest step any nation has ever taken to cut global warming pollution and save oil," he said.

Two of Pruitt's predecessors were harshly critical.

"All they care about is undoing everything the prior administration did, and they'll use any excuse for doing that. They don't even have the industry itself asking for this," said Gina McCarthy, EPA administrator under President Barack Obama and now director of Harvard's Center for Health and the Global Environment.

McCarthy said that the standards set during the Obama era were based on extensive negotiations with states and the federal government, as well as with the auto industry.

"The decision I made was based on real information," while Pruitt's decision seemed to have no factual basis, she said.

And former EPA administrator Carol M. Browner, who helped forge the initial carbon thresholds for cars and light trucks in 2009 while serving in the Obama White House, took issue with Pruitt's allegation that officials in California are somehow at fault, saying "this idea that California is dictating or arbitrating for the rest of the country is not accurate."

Rather, Browner said, federal and state officials in past administrations worked hard to reach a compromise that gave certainty to automakers while moving the nation to embrace more fuel-efficient vehicles.

"There's an opportunity for us to lead the global market in cleaner, more efficient cars," she said. "But [Trump officials] are simply going to walk away from that opportunity."

EPA Administrator Scott Pruitt is revoking Obama-era standards requiring cars and light trucks to average more than 50 miles per gallon by 2025

Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring cars and light trucks sold in the United States to average more than 50 miles per gallon by 2025, a move that could change the composition of the nation's auto fleet for years.

The push to rewrite the first-ever carbon limits on cars and SUVs, which came out of an agreement among federal officials, automakers and the state of California, is sure to spark a major political and legal battle.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if its waiver is revoked and it is blocked from imposing stricter targets. Such a fight has broad implications because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Donald Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety Administration would establish a standard that "allows auto manufacturers to make cars that people both want and can afford - while still expanding environmental and safety benefits of newer cars." The agency said he is still considering the status of California's waiver.

Officials in that state immediately excoriated the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at the potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said. The EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage - those rules remain in place."

EPA Administrator Scott Pruitt is revoking Obama-era standards requiring cars and light trucks to average more than 50 miles per gallon by 2025

Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring cars and light trucks sold in the United States to average more than 50 miles per gallon by 2025, a move that could change the composition of the nation's auto fleet for years.

The push to rewrite the first-ever carbon limits on cars and SUVs, which came out of an agreement among federal officials, automakers and the state of California, is sure to spark a major political and legal battle.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if its waiver is revoked and it is blocked from imposing stricter targets. Such a fight has broad implications because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Donald Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety Administration would establish a standard that "allows auto manufacturers to make cars that people both want and can afford - while still expanding environmental and safety benefits of newer cars." The agency said he is still considering the status of California's waiver.

Officials in that state immediately excoriated the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at the potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said. The EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage - those rules remain in place."

The efficiency gains that the U.S. auto fleet has made in recent decades have slowed since 2013, as gas prices dipped and the sale of pickup trucks and SUVs accelerated. In the document Pruitt signed Monday, he said EPA had been "optimistic in its assumptions and projections" about the availability of technology to meet the standards and had received substantial input from automakers that they needed to be scaled back.

He suggested that if cleaner vehicles are too expensive, consumers will hold onto older cars, thereby lowering the overall efficiency of cars on the road.

Peter Welch, president and chief executive of the National Automobile Dealers Association, said in a statement Monday that while the group supports "continuous improvements" in reducing vehicle emissions, "Standards alone - whatever they are - won't do the trick."

The Alliance of Automobile Manufacturers, whose members produce 70 percent of the cars and light trucks sold in the United States, endorsed the shift. The group estimates that it would be more realistic to require the fleet to reach a miles-per-gallon target in the high 40s by 2025.

The U.S. fleet averaged 31.8 mpg for model year 2017, according to federal figures.

Alliance spokeswoman Gloria Bergquist said in an email that her members "support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards. We appreciate that the administration is working to find a way to both increase fuel economy standards and keep new vehicles affordable to more Americans."

But two of those members, Ford and Honda, recently urged the government to maintain the current requirements but give manufacturers additional flexibility.

At the Safe Climate Campaign, Director Dan Becker projected that retaining the Obama rule would cut carbon dioxide emissions by 6 billion tons and save 12 billion barrels of oil over the lifetime of vehicles complying with these standards.

"Even though automakers are pushing gas-guzzling pickups and SUVs rather than more efficient cars, it's still the biggest step any nation has ever taken to cut global warming pollution and save oil," he said.

Two of Pruitt's predecessors were harshly critical.

"All they care about is undoing everything the prior administration did, and they'll use any excuse for doing that. They don't even have the industry itself asking for this," said Gina McCarthy, EPA administrator under President Barack Obama and now director of Harvard's Center for Health and the Global Environment.

McCarthy said that the standards set during the Obama era were based on extensive negotiations with states and the federal government, as well as with the auto industry.

"The decision I made was based on real information," while Pruitt's decision seemed to have no factual basis, she said.

And former EPA administrator Carol M. Browner, who helped forge the initial carbon thresholds for cars and light trucks in 2009 while serving in the Obama White House, took issue with Pruitt's allegation that officials in California are somehow at fault, saying "this idea that California is dictating or arbitrating for the rest of the country is not accurate."

Rather, Browner said, federal and state officials in past administrations worked hard to reach a compromise that gave certainty to automakers while moving the nation to embrace more fuel-efficient vehicles.

"There's an opportunity for us to lead the global market in cleaner, more efficient cars," she said. "But [Trump officials] are simply going to walk away from that opportunity."

SENATOR MARKEY CONDEMNS EPA MOVING TO ROLL BACK FUEL ECONOMY EMISSIONS STANDARDS

04/01/2018

States News Service

The following information was released by Massachusetts Senator Edward J. Markey:

Senator Edward J. Markey (D-Mass.), a member of the Environment and Public Works Committee and Chair of the Senate Climate Task Force, released the following statement after the Environmental Protection Agency (EPA) announced a revised so-called final determination that would relax standards requiring automakers to reduce emissions for model year 2022-2025 cars and light trucks. In January 2017, the Obama Administration EPA issued a final determination that these fuel economy emissions standards were feasible and achievable and should stay in place. The Obama administrations historic 54.5 mpg standard was partially enabled by the Energy Independence and Security Act of 2007, which included fuel economy standards co-authored by Senator Markey when he was in the House of Representatives.

The Trump administrations decision to roll back our fuel economy standards is an attack on American consumers, our national security and dependence on foreign oil, the competitiveness of the U.S. auto industry and our planet, said Senator Markey. These standards are technically feasible and economically achievable. Trying to slam the breaks on these standards isnt just unwarranted, its unbelievable.

Slashing these standards would amount to turning the keys to our energy policy over to Big Oil and the auto industry. I will use every legislative tool available to me in the Senate to block the Trump administration's attempts to gut these standards that benefit consumers, our security and our planet.

In December 2017, Senator Markey, Sheldon Whitehouse (D-R.I.), and Kamala Harris (D-Calif.) led a group of 24 Senators in calling on the EPA to not weaken light-duty vehicle emissions standards for model 2022-2025 and strenuously objecting to revisiting emissions standards for model year 2021, which were never supposed to be part of the EPA's midterm evaluation.

These standards are projected to save nearly 2.5 million barrels of oil a day by 2030 around as much oil as we currently import from OPEC countries every day-- save consumers over \$1 trillion and reduce global warming pollution by 6 billion metric tons. Since reaching an historic agreement with the Obama administration and state leaders, the auto industry has gone from the brink of economic disaster to record auto sales in 2015 and 2016, including adding 700,000 U.S. jobs.

GOV. MALLOY AND COMMISSIONER KLEE BLAST TRUMP ADMINISTRATION DECISION TO WEAKEN TAILPIPE EMISSIONS AND FUEL EFFICIENCY STANDARDS

04/01/2018**States News Service**

The following information was released by the office of the Governor of Connecticut:

Governor Dannel P. Malloy and Department of Energy and Environmental Protection (DEEP) Commissioner Rob Klee are criticizing a decision announced today by the U.S. Environmental Protection Agency to roll-back greenhouse gas and fuel economy standards for automobiles.

As we have seen too often from the Trump administration, the EPA's announcement today again abdicates its leadership role on climate, energy and the environment, Governor Malloy said. States have long led the way on many important issues, including climate change. President Trump is once again putting the interests of big business ahead of the health and economic interests of the American people. This shortsighted decision will lead to decreasing fuel efficiency, which means more frequent stops at the gas station and higher gas bills for Connecticut drivers. We will continue to work with California and other like-minded states to safeguard the protections provided by the federal Clean Air Act and the Advanced Clean Car program.

Human-induced climate change is the most significant environmental issue we face today, and taking action now to mitigate the most damaging impacts of climate change offers one of the greatest opportunities for reshaping, reenergizing, and transforming our economy to create the green jobs and green industries of the future, Commissioner Klee said. While this administration may actively try to prevent states from exerting their sovereign rights to fill the void created by federal inaction, we will continue to do our part as a national leader to reduce carbon emissions that contribute to climate change, and look forward to a time when our federal government again allows science and not the demands of the auto industry to drive the important goals and objectives of the advanced clean cars program.

California is allowed to set their own motor vehicle tailpipe standards in recognition of their unique air quality challenges and of their early efforts that pre-dated the federal Clean Air Act. Connecticut and 11 other states are authorized to adopt California's standards under section 177 of the federal Clean Air Act provided U.S. EPA first issues a waiver to California under section 209 of the federal Clean Air Act indicating California's standards are at least as stringent as federal standards.

The standards at issue are part of a broader agreement made in 2012 among the State of California, U.S. EPA, U.S. DOT/NHTSA and the major auto manufacturers. Under this agreement, California and the federal government agreed to harmonize state and federal tailpipe emission standards for greenhouse gases with federal fuel efficiency standards. The State of California agreed to find vehicles certified as meeting the federal tailpipe standards as being deemed in compliance with the California standards (also adopted by 12 other states, and when combined represent 35% of the national light duty vehicle market). The agreement included a mid-term evaluation during which California assessed three elements of the clean cars program: the zero-emission vehicle (ZEV) regulation, the one milligram per mile (mg/mi) particulate matter (PM) standard, and the light-duty vehicle greenhouse gas standards for 2022 and later model years. U.S. EPA agreed to conduct a similar review of the standards for model year 2022-25.

California's technical staff worked with U.S. EPA and NHTSA to review the federal light-duty greenhouse gas standards for 2022 through 2025 model years. This review included collaborating on a second joint Technical Assessment Report (TAR) to re-assess the technical assumptions and analysis used to develop the greenhouse gas standards. The Draft (Joint) TAR was published for public comment in July 2016. After reviewing public comments, U.S. EPA updated their analysis and published for public comment in November 2016 a Proposed Determination that the 2022 through 2025 federal standards remain as adopted. Subsequent to a review of public comment, U.S. EPA concluded their midterm evaluation and published a Final Determination in January 2017 that affirmed the existing federal greenhouse gas standards would remain as adopted. In March 2017, EPA rescinded the Final Determination, and announced that a new Final Determination would be published by April 1, 2018.

MATSUI CONDEMNS TRUMP ADMINISTRATION'S DECISION TO WEAKEN EPA CLEAN VEHICLE STANDARDS

04/01/2018

States News Service

The following information was released by the office of California Rep. Doris Matsui:

Congresswoman Doris Matsui (D-CA) released the following statement in response to the Trump Administration's decision to undermine the Environmental Protection Agency's light-duty vehicle greenhouse gas emissions standards adopted in 2012 by the Federal government, auto manufacturers, and more than a dozen state governments:

"Administrator Pruitt is taking yet another step to undermine the EPA's mission of protecting clean air and public health, and this time his decision will also cost drivers tens of billions of dollars at the pump. Last year, we saw greenhouse gas emissions from the transportation sector exceed electricity sector emissions for the first time in decades. Given the substantial impact of auto emissions on our changing climate, the administration should instead be maintaining the Federal government's commitment to cleaner, more efficient cars that are better for the environment and public health."

Congresswoman Matsui is the lead sponsor of the Clean and Efficient Cars Act of 2018 , which would codify the EPA's light-duty vehicle greenhouse gas emissions standards and the Department of Transportation's Corporate Average Fuel Economy (CAFE) standards for model years 2021 to 2025. It would also block the agencies from creating loopholes in the standards.

While this administration may actively try to prevent states from exerting their sovereign rights to fill the void created by federal inaction, we will continue to do our part as a national leader to reduce carbon emissions that contribute to climate change, and look forward to a time when our federal government again allows science and not the demands of the auto industry to drive the important goals and objectives of the advanced clean cars program.

California is allowed to set their own motor vehicle tailpipe standards in recognition of their unique air quality challenges and of their early efforts that pre-dated the federal Clean Air Act. Connecticut and 11 other states are authorized to adopt Californias standards under section 177 of the federal Clean Air Act provided U.S. EPA first issues a waiver to California under section 209 of the federal Clean Air Act indicating Californias standards are at least as stringent as federal standards.

The standards at issue are part of a broader agreement made in 2012 among the State of California, U.S. EPA, U.S. DOT/NHSTA and the major auto manufacturers. Under this agreement, California and the federal government agreed to harmonize state and federal tailpipe emission standards for greenhouse gases with federal fuel efficiency standards. The State of California agreed to find vehicles certified as meeting the federal tailpipe standards as being deemed in compliance with the California standards (also adopted by 12 other states, and when combined represent 35% of the national light duty vehicle market). The agreement included a mid-term evaluation during which California assessed three elements of the

clean cars program: the zero-emission vehicle (ZEV) regulation, the one milligram per mile (mg/mi) particulate matter (PM) standard, and the light-duty vehicle greenhouse gas standards for 2022 and later model years. U.S. EPA agreed to conduct a similar review of the standards for model year 2022-25.

Californias technical staff worked with U.S. EPA and NHTSA to review the federal light-duty greenhouse gas standards for 2022 through 2025 model years. This review included collaborating on a second joint Technical Assessment Report (TAR) to re-assess the technical assumptions and analysis used to develop the greenhouse gas standards. The Draft (Joint) TAR was published for public comment in July 2016. After reviewing public comments, U.S. EPA updated their analysis and published for public comment in November 2016 a Proposed Determination that the 2022 through 2025 federal standards remain as adopted. Subsequent to a review of public comment, U.S. EPA concluded their midterm evaluation and published a Final Determination in January 2017 that affirmed the existing federal greenhouse gas standards would remain as adopted. In March 2017, EPA rescinded the Final Determination, and announced that a new Final Determination would be published by April 1, 2018.

EPA Says Greenhouse Gas Emissions Standards For Cars, Trucks Should Be Revised**04/01/2018*****CE Noticias Financieras English***

U.S. Environmental Protection Agency or EPA Administrator Scott Pruitt announced the completion of the Midterm Evaluation or MTE process for the greenhouse gas or GHG emissions standards for cars and light trucks for model years 2022-2025, and his final determination that, in light of recent data, the current standards are not appropriate and should be revised.

Administrator Pruitt also announced the start of a joint process with the National Highway Traffic Safety Administration or NHTSA to develop a notice and comment rulemaking to set more appropriate GHG emissions standards and Corporate Average Fuel Economy (CAFE) standards.

"The Obama Administration's determination was wrong," said EPA Administrator Scott Pruitt. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

EPA to roll back Obama-era fuel efficiency standards**04/01/2018*****United Press International***

The U.S. Environmental Protection Agency announced plans Monday to relax fuel efficiency standards for motor vehicles.

EPA Administrator Scott Pruitt determined current standards are "not appropriate and should be revised" after conducting the midterm evaluation process for the greenhouse gas emissions for cars and light trucks for model years 2022 through 2025.

"The Obama administration's determination was wrong," Pruitt said. "Obama's EPA cut the midterm evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

In March, President Donald Trump promised a review of rules submitted by the Obama administration mandating an increase in fuel economy for all domestic vehicles to an average of 54.5 miles per gallon by 2025.

Pruitt didn't offer specific guidelines for revising the previous standards following the review.

The EPA is also re-examining a waiver granted to California, which allows the state to impose stricter standards for vehicle emissions of certain pollutants than federal requirements established under the Clean Air Act.

Pruitt said a national standard "is in America's best interest" and the EPA will work with California and other states in an effort to achieve such a standard.

"Cooperative federalism doesn't mean that one state can dictate standards for the rest of the country. EPA will set a national standard for greenhouse gas emissions that allows auto manufacturers to make cars that people both want and can afford -- while still expanding environmental and safety benefits of newer cars," he said.

A.G. Schneiderman Statement On Trump Administration Rollback Of National Auto Fuel Economy And Pollution Standards
04/01/2018***State Capital News Feed***

Apr 02, 2018(Attorney General Eric T. Schneiderman: <http://www.ag.ny.gov/Delivered by Newstex>) News from Attorney General Eric T. Schneiderman FOR IMMEDIATE RELEASE April 2, 2018 Attorney General's Press Office / 212-416-8060 nyag.pressoffice@ag.ny.gov<mailto:nyag.pressoffice@ag.ny.gov>Twitter: @AGSchneiderman ; A.G. SCHNEIDERMAN STATEMENT ON TRUMP ADMINISTRATION ROLLBACK OF NATIONAL AUTO FUEL ECONOMY AND POLLUTION STANDARDS New York Attorney General Eric T. Schneiderman released the following statement on the Trump Administration's announcement today that it will roll back national fuel economy and pollution standards for automobiles: 'By cooking the books on its review of national auto emissions standards, the Trump Administration is putting special interests ahead of New Yorkers' health and wallets. 'This illegal rollback of achievable, common sense fuel efficiency and pollution standards for cars will result in higher fuel costs and more dangerous air pollution, including the carbon dioxide that drives climate change - creating real, direct, and damaging impacts on New Yorkers and our environment.

'We stand ready to take legal action to block the Trump administration's reckless and illegal efforts to reverse these critical standards and the gains we've made in ensuring cars are more fuel-efficient and less polluting.' Background In 2012, EPA and the National Highway Safety and Transportation Administration jointly adopted national greenhouse gas emissions/fuel economy standards for cars to be sold in 2017-2025. Because of the standards' long time horizon, EPA agreed to perform a midterm evaluation for the standards for 2022-2025 to confirm that the standards remain achievable. Based on an exhaustive record that included state-of-the-art research, input from stakeholders, and published literature and studies, EPA concluded in January 2017 that the 2022-25 standards are feasible at reasonable cost, will achieve significant carbon dioxide emissions reductions, and will provide significant economic and environmental benefits to consumers. But today, EPA Administrator Scott Pruitt announced that EPA will revise the standards. Attorney General Schneiderman has been a leader in forcing the federal government to follow its duty under the federal Clean Air Act to ensure the adoption and implementation of national standards that make cars more fuel-efficient and less polluting. In response to Administrator Pruitt's May 2017 letter to California Governor Jerry Brown contending that the midterm evaluation process was legally flawed, Attorney General Schneiderman led a coalition of Attorneys General who vowed to pursue legal action if

necessary[1]. Likewise, during EPA's rulemaking process to reconsider the midterm evaluation, Attorney General Schneiderman led a similar group in submitting a comment[2] demonstrating that the administrative record supports strengthening, not weakening, the standards. [1]: <https://ag.ny.gov/press-release/ag-schneiderman-leading-coalition-14-ags-promises-legal-fight-if-trump-administration> [2]: https://ag.ny.gov/sites/default/files/ny_et_al_comments_on_epa_reconsideration.pdf

EPA Begins Revision of Obama Climate Regulations for Cars, Trucks

04/01/2018

State Capital News Feed

Apr 02, 2018(Western Free Press: [http://www.westernfreepress.com/Delivered by Newstex](http://www.westernfreepress.com/Delivered%20by%20Newstex)); EPA chief Scott Pruitt said Monday that the Obama administration's fuel economy regulations aren't appropriate and his agency will help revise them. Pruitt, administrator of the Environmental Protection Agency, said the EPA and the National Highway Traffic Safety Administration would begin crafting new greenhouse gas emission and mileage standards for vehicles built in 2022 through 2025.'The Obama EPA's determination was wrong,' Pruitt said in a written statement about the Corporate Average Fuel Economy, or CAFE, standards. He said:Obama's EPA cut the midterm evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high.The EPA's revising of the Corporate Average Fuel Economy regulations put the agency on a collision course with California state officials.

The Golden State got permissions from the Obama administration to issue its own, higher emissions standards. Conservative groups have urged Pruitt to repeal California's waiver, arguing the state can use its influence over automakers to supplant federal standards. The EPA is still examining California's waiver, but Pruitt seemed critical of continuing the policy as it stands. 'Cooperative federalism doesn't mean that one state can dictate standards for the rest of the country,' Pruitt said. 'EPA will set a national standard for greenhouse gas emissions that allows auto manufacturers to make cars that people both want and can afford while still expanding environmental and safety benefits of newer cars.' 'It's in everyone's best interest to have a national standard, and we look forward to working with all states, including California, as we work to finalize that standard,' he said. The EPA also is moving against[1] former President Barack Obama's emissions pledge under the Paris climate accord, which he joined in 2016. Obama committed the U.S. to cut greenhouse gas emissions 26 to 28 percent by 2025. The Obama rules required cars to get 54.5 miles per gallon by 2025. Officials estimated the rules would cut 540 million metric tons of carbon dioxide emissions and save consumers money. However, automakers missed[2] fuel efficiency targets for model year 2016 cars and light trucks by about 9 grams per mile. The Obama EPA's own analysis found[3] cars may not meet the 2025 target, likely getting between 50 and 52.6 miles per gallon by then. EPA will reverse Obama-era standards on vehicle emissions

04/02/2018

Washington Post, The

Rewrite of fuel-efficiency goals expected to spark political, legal battles

Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring cars and light trucks sold in the United States to average more than 50 miles per gallon by 2025, a move that could change the composition of the nation's auto fleet for years.

The push to rewrite the first carbon limits on cars and SUVs, which came out of an agreement among federal officials, automakers and the state of California, is sure to spark major political and legal battles.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if its waiver is revoked and it is blocked from imposing stricter targets. Such a fight has broad implications, because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety Administration would establish a standard that "allows auto manufacturers to make cars that people both want and can afford - while still expanding environmental and safety benefits of newer cars." The agency said he is still considering the status of California's waiver.

Officials in that state immediately excoriated the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at a potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said. The EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage - those rules remain in place."

The efficiency gains that the U.S. auto fleet has made in recent decades have slowed since 2013, as gas prices dipped and the sale of pickup trucks and SUVs accelerated. In the document Pruitt signed Monday, he said the EPA had been "optimistic in its assumptions and projections" about the availability of technology to meet the standards and the agency recently had received substantial input from automakers that they needed to be scaled back.

He suggested that if cleaner vehicles are too expensive, consumers will hold onto older cars, thereby lowering the overall efficiency of cars on the road.

Peter Welch, president and chief executive of the National Automobile Dealers Association, said in a statement Monday that while the group supports "continuous improvements" in reducing vehicle emissions, "Standards alone - whatever they are - won't do the trick."

The Alliance of Automobile Manufacturers, whose members produce 70 percent of the cars and light trucks sold in the United States, endorsed the shift. The group estimates that it would be more realistic to require the fleet to reach a miles-per-gallon target in the high 40s by 2025.

The U.S. fleet averaged 31.8 mpg for model year 2017, according to federal figures.

Alliance spokeswoman Gloria Bergquist said in an email that her members "support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards. We appreciate that the administration is working to find a way to both increase fuel economy standards and keep new vehicles affordable to more Americans."

But two of those members, Ford and Honda, recently urged the government to maintain the current requirements but give manufacturers additional flexibility.

Dan Becker, director of the Safe Climate Campaign, projected that retaining the Obama rule would cut carbon dioxide emissions by 6 billion tons and save 12 billion barrels of oil over the lifetime of vehicles complying with these standards. "Even though automakers are pushing gas-guzzling pickups and SUVs rather than more efficient cars, it's still the biggest step any nation has ever taken to cut global warming pollution and save oil," he said.

Two of Pruitt's predecessors were harshly critical.

"All they care about is undoing everything the prior administration did, and they'll use any excuse for doing that. They don't even have the industry itself asking for this," said Gina McCarthy, EPA administrator under President Barack Obama and now director of Harvard's Center for Health and the Global Environment.

McCarthy said that the standards set during the Obama era were based on extensive negotiations with states and the federal government, as well as the auto industry. "The decision I made was based on real information," while Pruitt's decision seemed to have no factual basis, she said.

And former EPA administrator Carol M. Browner, who helped forge the initial carbon thresholds for cars and light trucks in 2009 while serving in the Obama White House, took issue with Pruitt's allegation that officials in California are somehow at fault, saying "this idea that California is dictating or arbitrating for the rest of the country is not accurate."

Rather, Browner said, federal and state officials in past administrations worked to reach a compromise that gave certainty to automakers while moving the nation to embrace more fuel-efficient vehicles.

"There's an opportunity for us to lead the global market in cleaner, more efficient cars," she said. "But [Trump officials] are simply going to walk away from that opportunity."

The U.S. fleet averaged 31.8 mpg for model year 2017, according to federal figures.

Alliance spokeswoman Gloria Bergquist said in an email that her members "support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards. We appreciate that the administration is working to find a way to both increase fuel economy standards and keep new vehicles affordable to more Americans."

But two of those members, Ford and Honda, recently urged the government to maintain the current requirements but give manufacturers additional flexibility.

Dan Becker, director of the Safe Climate Campaign, projected that retaining the Obama rule would cut carbon dioxide emissions by 6 billion tons and save 12 billion barrels of oil over the lifetime of vehicles complying with these standards. "Even though automakers are pushing gas-guzzling pickups and SUVs rather than more efficient cars, it's still the biggest step any nation has ever taken to cut global warming pollution and save oil," he said.

Two of Pruitt's predecessors were harshly critical.

"All they care about is undoing everything the prior administration did, and they'll use any excuse for doing that. They don't even have the industry itself asking for this," said Gina McCarthy, EPA administrator under President Barack Obama and now director of Harvard's Center for Health and the Global Environment.

McCarthy said that the standards set during the Obama era were based on extensive negotiations with states and the federal government, as well as the auto industry. "The decision I made was based on real information," while Pruitt's decision seemed to have no factual basis, she said.

And former EPA administrator Carol M. Browner, who helped forge the initial carbon thresholds for cars and light trucks in 2009 while serving in the Obama White House, took issue with Pruitt's allegation that officials in California are somehow at fault, saying "this idea that California is dictating or arbitrating for the rest of the country is not accurate."

Rather, Browner said, federal and state officials in past administrations worked to reach a compromise that gave certainty to automakers while moving the nation to embrace more fuel-efficient vehicles.

"There's an opportunity for us to lead the global market in cleaner, more efficient cars," she said. "But [Trump officials] are simply going to walk away from that opportunity."

EPA will reverse Obama-era standards on vehicle emissions

04/02/2018

Washington Post, The

Rewrite of fuel-efficiency goals expected to spark political, legal battles

Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring cars and light trucks sold in the United States to average more than 50 miles per gallon by 2025, a move that could change the composition of the nation's auto fleet for years.

The push to rewrite the first carbon limits on cars and SUVs, which came out of an agreement among federal officials, automakers and the state of California, is sure to spark major political and legal battles.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if its waiver is revoked and it is blocked from imposing stricter targets. Such a fight has broad implications, because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety

Administration would establish a standard that "allows auto manufacturers to make cars that people both want and can afford - while still expanding environmental and safety benefits of newer cars." The agency said he is still considering the status of California's waiver.

Officials in that state immediately excoriated the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at a potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said. The EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage - those rules remain in place."

The efficiency gains that the U.S. auto fleet has made in recent decades have slowed since 2013, as gas prices dipped and the sale of pickup trucks and SUVs accelerated. In the document Pruitt signed Monday, he said the EPA had been "optimistic in its assumptions and projections" about the availability of technology to meet the standards and the agency recently had received substantial input from automakers that they needed to be scaled back.

He suggested that if cleaner vehicles are too expensive, consumers will hold onto older cars, thereby lowering the overall efficiency of cars on the road.

Peter Welch, president and chief executive of the National Automobile Dealers Association, said in a statement Monday that while the group supports "continuous improvements" in reducing vehicle emissions, "Standards alone - whatever they are - won't do the trick."

The Alliance of Automobile Manufacturers, whose members produce 70 percent of the cars and light trucks sold in the United States, endorsed the shift. The group estimates that it would be more realistic to require the fleet to reach a miles-per-gallon target in the high 40s by 2025.

The U.S. fleet averaged 31.8 mpg for model year 2017, according to federal figures.

Alliance spokeswoman Gloria Bergquist said in an email that her members "support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards. We appreciate that the administration is working to find a way to both increase fuel economy standards and keep new vehicles affordable to more Americans."

But two of those members, Ford and Honda, recently urged the government to maintain the current requirements but give manufacturers additional flexibility.

Dan Becker, director of the Safe Climate Campaign, projected that retaining the Obama rule would cut carbon dioxide emissions by 6 billion tons and save 12 billion barrels of oil over the lifetime of vehicles complying with these standards. EPA to ease fuel-economy standards for cars, trucks

04/02/2018

USA Today

WASHINGTON - The Trump administration on Monday announced that it would revise tough mileage-per-gallon fuel standards for cars and light trucks, saying the rules agreed to during President Obama's time in office were "not appropriate."

"The Obama administration's determination was wrong," said Scott Pruitt, head of the Environmental Protection Agency. "Obama's EPA cut the midterm evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality and set the standards too high."

Pruitt did not say when new standards would be set.

The decision, while expected, means several states, led by California, will likely press courts to allow them to keep tougher standards in place, which could force automakers to produce different cars for sale in different areas.

Meanwhile, environmentalists argue that any rollback will hurt human health and exacerbate climate change.

"The Trump administration's decision will take America backward by jeopardizing successful safeguards that are working to clean our air, save drivers money at the pump and drive technological innovation that creates jobs," said Luke Tonachel, director of the Natural Resources Defense Council's Clean Vehicles and Fuels Project. "The American public overwhelmingly supports strong vehicle standards."

Automakers, on the other hand, said the EPA's ruling was the right one in order to keep vehicles affordable and let business -- not bureaucrats -- take the lead in determining how best to increase fuel economy standards while protecting their bottom line.

"This was the right decision, and we support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards," said Gloria Bergquist, a vice president for the Alliance of Automobile Manufacturers, a trade group that represents General Motors, Ford, Fiat Chrysler and others.

To "ensure ongoing fuel economy improvement, the wisest course of action is to keep new vehicles affordable so more consumers can replace an older car with a new vehicle that uses much less fuel -- and offers more safety features," Bergquist said.

Bergquist said that it is critical to maintain a "single national" standard for vehicles and will work with environmentalists, California officials and the National Highway Traffic Safety Administration to attempt to do so.

But there is no guarantee such an effort will succeed. California Attorney General Xavier Becerra last year filed a lawsuit along with other states in an attempt to force the Trump administration to meet the tougher standards.

Automakers, state officials, environmentalists and federal regulators had agreed in 2012 to increase fuel efficiency standards to average 34.5 mpg by 2016 across the fleet of American cars and trucks with the figure then to grow to 54.5 mpg by 2025.

But that process called for a so-called midterm review, during which time automakers and others wanted the greater number to be revisited. Before Obama left office in early 2017, the EPA issued a ruling keeping the higher number in place -- a decision that President Trump made clear last year he intended to revisit.

Pruitt said Monday that his agency's new midterm evaluation determined that the standards needed to be revised, though he didn't make any suggestions as to what would be an appropriate new standard.

Under the Clean Air Act, the EPA sets national standards for vehicle tailpipe emissions of certain pollutants, though California long has had a waiver to impose tougher standards. The EPA said it was reviewing California's waiver as well.

Opposing View: Fuel rules will jack up vehicle sticker prices

04/02/2018

USA Today

When the Obama Environmental Protection Agency set greenhouse gas emission standards for vehicles, they set a half-way "check-up" to see if the standards are working as intended.

Under this Mid-Term Evaluation Review, the National Highway Traffic Safety Administration and EPA were supposed to jointly give their takeaways from the review and thoughts on the next half of the rule, for the years 2022-25, by April 2018.

However, the Obama EPA unilaterally issued its own final determination just seven days before President Trump was sworn into office.

The purpose of the review was to adjust the targets if circumstances change. When the rule was originally finalized, EPA projected gas prices near \$4 per gallon by now, and sales of electric vehicles and hybrids growing rapidly. However, technology has helped find new oil across the U.S., keeping prices well below \$3 per gallon. Consumer preferences have also reflected a strong preference for SUVs, crossovers and pickups. As a result, updated standards must reflect these realities.

If the environment is truly the consideration, the goal must be one nationwide standard for industry that allows it to produce affordable vehicles with better fuel efficiency that consumers can afford to buy. Why? This will allow our nation to get older, less fuel efficient, dirtier vehicles off our roads to improve air quality.

EPA estimates that the Obama-era rules would add more than \$2,800 to sticker prices when fully implemented. Family-sized vehicles are likely to be hardest hit.

The standards are developed and the review was scheduled precisely to ensure the process is working properly. To succeed, our nation's fuel efficiency standards must be balanced with air quality, safety and consumer preferences in mind. The government is not here to dictate or pick winners and losers to achieve a predetermined outcome. We must allow the data to drive the process, not politics.

Rep. Pete Olson, R-Texas, is vice chair of the House Energy and Power Subcommittee.

EPA to ease fuel-economy standards for cars, trucks

04/02/2018

USA Today

WASHINGTON - The Trump administration on Monday announced that it would revise tough mileage-per-gallon fuel standards for cars and light trucks, saying the rules agreed to during President Obama's time in office were "not appropriate."

"The Obama administration's determination was wrong," said Scott Pruitt, head of the Environmental Protection Agency. "Obama's EPA cut the midterm evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality and set the standards too high."

Pruitt did not say when new standards would be set.

The decision, while expected, means several states, led by California, will likely press courts to allow them to keep tougher standards in place, which could force automakers to produce different cars for sale in different areas.

Meanwhile, environmentalists argue that any rollback will hurt human health and exacerbate climate change.

"The Trump administration's decision will take America backward by jeopardizing successful safeguards that are working to clean our air, save drivers money at the pump and drive technological innovation that creates jobs," said Luke Tonachel, director of the Natural Resources Defense Council's Clean Vehicles and Fuels Project. "The American public overwhelmingly supports strong vehicle standards."

Automakers, on the other hand, said the EPA's ruling was the right one in order to keep vehicles affordable and let business -- not bureaucrats -- take the lead in determining how best to increase fuel economy standards while protecting their bottom line.

"This was the right decision, and we support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards," said Gloria Bergquist, a vice president for the Alliance of Automobile Manufacturers, a trade group that represents General Motors, Ford, Fiat Chrysler and others.

To "ensure ongoing fuel economy improvement, the wisest course of action is to keep new vehicles affordable so more consumers can replace an older car with a new vehicle that uses much less fuel -- and offers more safety features," Bergquist said.

Bergquist said that it is critical to maintain a "single national" standard for vehicles and will work with environmentalists, California officials and the National Highway Traffic Safety Administration to attempt to do so.

But there is no guarantee such an effort will succeed. California Attorney General Xavier Becerra last year filed a lawsuit along with other states in an attempt to force the Trump administration to meet the tougher standards.

Automakers, state officials, environmentalists and federal regulators had agreed in 2012 to increase fuel efficiency standards to average 34.5 mpg by 2016 across the fleet of American cars and trucks with the figure then to grow to 54.5 mpg by 2025.

But that process called for a so-called midterm review, during which time automakers and others wanted the greater number to be revisited. Before Obama left office in early 2017, the EPA issued a ruling keeping the higher number in place -- a decision that President Trump made clear last year he intended to revisit.

Pruitt said Monday that his agency's new midterm evaluation determined that the standards needed to be revised, though he didn't make any suggestions as to what would be an appropriate new standard.

Under the Clean Air Act, the EPA sets national standards for vehicle tailpipe emissions of certain pollutants, though California long has had a waiver to impose tougher standards. The EPA said it was reviewing California's waiver as well.

Opposing View: Fuel rules will jack up vehicle sticker prices

04/02/2018

USA Today

When the Obama Environmental Protection Agency set greenhouse gas emission standards for vehicles, they set a half-way "check-up" to see if the standards are working as intended.

Under this Mid-Term Evaluation Review, the National Highway Traffic Safety Administration and EPA were supposed to jointly give their takeaways from the review and thoughts on the next half of the rule, for the years 2022-25, by April 2018.

However, the Obama EPA unilaterally issued its own final determination just seven days before President Trump was sworn into office.

The purpose of the review was to adjust the targets if circumstances change. When the rule was originally finalized, EPA projected gas prices near \$4 per gallon by now, and sales of electric vehicles and hybrids growing rapidly. However, technology has helped find new oil across the U.S., keeping prices well below \$3 per gallon. Consumer preferences have also reflected a strong preference for SUVs, crossovers and pickups. As a result, updated standards must reflect these realities.

If the environment is truly the consideration, the goal must be one nationwide standard for industry that allows it to produce affordable vehicles with better fuel efficiency that consumers can afford to buy. Why? This will allow our nation to get older, less fuel efficient, dirtier vehicles off our roads to improve air quality.

EPA estimates that the Obama-era rules would add more than \$2,800 to sticker prices when fully implemented. Family-sized vehicles are likely to be hardest hit.

The standards are developed and the review was scheduled precisely to ensure the process is working properly. To succeed, our nation's fuel efficiency standards must be balanced with air quality, safety and consumer preferences in mind. The government is not here to dictate or pick winners and losers to achieve a predetermined outcome. We must allow the data to drive the process, not politics.

EPA to ease fuel-economy standards for cars, trucks

04/02/2018

USA Today

WASHINGTON - The Trump administration on Monday announced that it would revise tough mileage-per-gallon fuel standards for cars and light trucks, saying the rules agreed to during President Obama's time in office were "not appropriate."

"The Obama administration's determination was wrong," said Scott Pruitt, head of the Environmental Protection Agency. "Obama's EPA cut the midterm evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality and set the standards too high."

Pruitt did not say when new standards would be set.

The decision, while expected, means several states, led by California, will likely press courts to allow them to keep tougher standards in place, which could force automakers to produce different cars for sale in different areas.

Meanwhile, environmentalists argue that any rollback will hurt human health and exacerbate climate change.

"The Trump administration's decision will take America backward by jeopardizing successful safeguards that are working to clean our air, save drivers money at the pump and drive technological innovation that creates jobs," said Luke Tonachel, director of the Natural Resources Defense Council's Clean Vehicles and Fuels Project. "The American public overwhelmingly supports strong vehicle standards."

Automakers, on the other hand, said the EPA's ruling was the right one in order to keep vehicles affordable and let business -- not bureaucrats -- take the lead in determining how best to increase fuel economy standards while protecting their bottom line.

"This was the right decision, and we support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards," said Gloria Bergquist, a vice president for the Alliance of Automobile Manufacturers, a trade group that represents General Motors, Ford, Fiat Chrysler and others.

To "ensure ongoing fuel economy improvement, the wisest course of action is to keep new vehicles affordable so more consumers can replace an older car with a new vehicle that uses much less fuel -- and offers more safety features," Bergquist said.

Bergquist said that it is critical to maintain a "single national" standard for vehicles and will work with environmentalists, California officials and the National Highway Traffic Safety Administration to attempt to do so.

But there is no guarantee such an effort will succeed. California Attorney General Xavier Becerra last year filed a lawsuit along with other states in an attempt to force the Trump administration to meet the tougher standards.

2018-04-02

Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring cars and light trucks sold in the United States to average more than 50 miles per gallon by 2025, a move that could change the composition of the nation's auto fleet for years.

The push to rewrite the first-ever carbon limits on cars and SUVs, which came out of an agreement among federal officials, automakers and the state of California, is sure to spark a major political and legal battle.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if its waiver is revoked and it is blocked from imposing stricter targets. Such a fight has broad implications because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Donald Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety Administration would establish a standard that "allows auto manufacturers to make cars that people both want and can afford - while still expanding environmental and safety benefits of newer cars." The agency said he is still considering the status of California's waiver.

Officials in that state immediately excoriated the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at the potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said. The EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage - those rules remain in place."

The efficiency gains that the U.S. auto fleet has made in recent decades have slowed since 2013, as gas prices dipped and the sale of pickup trucks and SUVs accelerated. In the document Pruitt signed Monday, he said EPA had been "optimistic in its assumptions and projections" about the availability of technology to meet the standards and had received substantial input from automakers that they needed to be scaled back.

He suggested that if cleaner vehicles are too expensive, consumers will hold onto older cars, thereby lowering the overall efficiency of cars on the road.

Peter Welch, president and chief executive of the National Automobile Dealers Association, said in a statement Monday that while the group supports "continuous improvements" in reducing vehicle emissions, "Standards alone - whatever they are - won't do the trick."

The Alliance of Automobile Manufacturers, whose members produce 70 percent of the cars and light trucks sold in the United States, endorsed the shift. The group estimates that it would be more realistic to require the fleet to reach a miles-per-gallon target in the high 40s by 2025.

The U.S. fleet averaged 31.8 mpg for model year 2017, according to federal figures.

Alliance spokeswoman Gloria Bergquist said in an email that her members "support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards. We appreciate that the administration is working to find a way to both increase fuel economy standards and keep new vehicles affordable to more Americans."

But two of those members, Ford and Honda, recently urged the government to maintain the current requirements but give manufacturers additional flexibility.

At the Safe Climate Campaign, Director Dan Becker projected that retaining the Obama rule would cut carbon dioxide emissions by 6 billion tons and save 12 billion barrels of oil over the lifetime of vehicles complying with these standards.

"Even though automakers are pushing gas-guzzling pickups and SUVs rather than more efficient cars, it's still the biggest step any nation has ever taken to cut global warming pollution and save oil," he said.

Two of Pruitt's predecessors were harshly critical.

"All they care about is undoing everything the prior administration did, and they'll use any excuse for doing that. They don't even have the industry itself asking for this," said Gina McCarthy, EPA administrator under President Barack Obama and now director of Harvard's Center for Health and the Global Environment.

McCarthy said that the standards set during the Obama era were based on extensive negotiations with states and the federal government, as well as with the auto industry.

"The decision I made was based on real information," while Pruitt's decision seemed to have no factual basis, she said.

And former EPA administrator Carol M. Browner, who helped forge the initial carbon thresholds for cars and light trucks in 2009 while serving in the Obama White House, took issue with Pruitt's allegation that officials in California are somehow at fault, saying "this idea that California is dictating or arbitrating for the rest of the country is not accurate."

Rather, Browner said, federal and state officials in past administrations worked hard to reach a compromise that gave certainty to automakers while moving the nation to embrace more fuel-efficient vehicles.

"There's an opportunity for us to lead the global market in cleaner, more efficient cars," she said. "But [Trump officials] are simply going to walk away from that opportunity."

EPA to roll back Obama-era car fuel, emissions standards | [View Clip](#)**04/03/2018*****South Florida Sun Sentinel Online***

2018-04-02

Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring cars and light trucks sold in the United States to average more than 50 miles per gallon by 2025, a move that could change the composition of the nation's auto fleet for years.

The push to rewrite the first-ever carbon limits on cars and SUVs, which came out of an agreement among federal officials, automakers and the state of California, is sure to spark a major political and legal battle.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if its waiver is revoked and it is blocked from imposing stricter targets. Such a fight has broad implications because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Donald Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety Administration would establish a standard that "allows auto manufacturers to make cars that people both want and can afford - while still expanding environmental and safety benefits of newer cars." The agency said he is still considering the status of California's waiver.

Officials in that state immediately excoriated the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at the potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said. The EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage - those rules remain in place."

The efficiency gains that the U.S. auto fleet has made in recent decades have slowed since 2013, as gas prices dipped and the sale of pickup trucks and SUVs accelerated. In the document Pruitt signed Monday, he said EPA had been "optimistic in its assumptions and projections" about the availability of technology to meet the standards and had received substantial input from automakers that they needed to be scaled back.

He suggested that if cleaner vehicles are too expensive, consumers will hold onto older cars, thereby lowering the overall efficiency of cars on the road.

Peter Welch, president and chief executive of the National Automobile Dealers Association, said in a statement Monday that while the group supports "continuous improvements" in reducing vehicle emissions, "Standards alone - whatever they are - won't do the trick."

The Alliance of Automobile Manufacturers, whose members produce 70 percent of the cars and light trucks sold in the United States, endorsed the shift. The group estimates that it would be more realistic to require the fleet to reach a miles-per-gallon target in the high 40s by 2025.

The U.S. fleet averaged 31.8 mpg for model year 2017, according to federal figures.

Alliance spokeswoman Gloria Bergquist said in an email that her members "support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards. We appreciate that the administration is working to find a way to both increase fuel economy standards and keep new vehicles affordable to more Americans."

But two of those members, Ford and Honda, recently urged the government to maintain the current requirements but give manufacturers additional flexibility.

At the Safe Climate Campaign, Director Dan Becker projected that retaining the Obama rule would cut carbon dioxide emissions by 6 billion tons and save 12 billion barrels of oil over the lifetime of vehicles complying with these standards.

"Even though automakers are pushing gas-guzzling pickups and SUVs rather than more efficient cars, it's still the biggest step any nation has ever taken to cut global warming pollution and save oil," he said.

Two of Pruitt's predecessors were harshly critical.

"All they care about is undoing everything the prior administration did, and they'll use any excuse for doing that. They don't even have the industry itself asking for this," said Gina McCarthy, EPA administrator under President Barack Obama and now director of Harvard's Center for Health and the Global Environment.

McCarthy said that the standards set during the Obama era were based on extensive negotiations with states and the federal government, as well as with the auto industry.

"The decision I made was based on real information," while Pruitt's decision seemed to have no factual basis, she said.

And former EPA administrator Carol M. Browner, who helped forge the initial carbon thresholds for cars and light trucks in 2009 while serving in the Obama White House, took issue with Pruitt's allegation that officials in California are somehow at fault, saying "this idea that California is dictating or arbitrating for the rest of the country is not accurate."

Rather, Browner said, federal and state officials in past administrations worked hard to reach a compromise that gave certainty to automakers while moving the nation to embrace more fuel-efficient vehicles.

"There's an opportunity for us to lead the global market in cleaner, more efficient cars," she said. "But [Trump officials] are simply going to walk away from that opportunity."

Facebook CEO defends ad-supported business model

The CEO of Facebook is defending its advertising-supported business model.

Mark Zuckerberg's defense comes after Apple CEO Tim Cook said his company wouldn't be in Facebook's situation because Apple doesn't sell ads based on customer data the way Facebook does. Zuckerberg responded Monday that an advertising-supported business model is the only way that the service can survive because not everyone would be able to pay for Facebook if it charged a fee.

He says the idea that Facebook doesn't care about its customers is "extremely glib."

Facebook is facing scrutiny over its data collection following allegations that political consulting firm Cambridge Analytica obtained data on tens of millions of Facebook users to try to influence elections.

FirstEnergy unit files for Chapter 11

A subsidiary that runs FirstEnergy Corp.'s nuclear and coal-fired power plants has filed for bankruptcy protection after the utility said earlier that it planned to close its three nuclear plants in Ohio and Pennsylvania.

The move announced by FirstEnergy Solutions late Saturday signals the parent company's plan to get out of the power producing business and concentrate on supplying electricity.

The subsidiary, which has been saddled by mounting debt, said in a statement that it's seeking bankruptcy protection to "facilitate an orderly financial restructuring" and believes the filing is in the best interests of the company and creditors.

The filing for bankruptcy protection includes FirstEnergy Solutions, along with all FES subsidiaries and FirstEnergy Nuclear Operating Co., according to the statement.

FirstEnergy Corp., parent of FirstEnergy Solutions and the FirstEnergy Nuclear Operating Co., is not part of the filing.

Donald R. Schneider, president of FirstEnergy Solutions, said the boards of directors for FirstEnergy Solutions and FirstEnergy Nuclear Operating Co. determined that the Chapter 11 filing represents "our best path forward as we continue to pursue opportunities for restructuring, asset sales and legislative and regulatory relief."

FirstEnergy Solutions and its subsidiaries collectively have more than \$550 million in cash, which they believe is "sufficient to continue normal operations and meet post-petition obligations to employees, suppliers and customers as they come due," according to the statement.

The company's aging and costly fleet of coal and nuclear plants has been unable to compete in recent years with the growing number of natural gas power plants in the East and Midwest.

FirstEnergy first warned that it could be forced to close its power plants in Ohio four years ago when it sought to change how it is paid for electricity.

It also has been unable to get financial help from federal and state leaders to keep its nuclear plants operating.

The utility said on March 28 that it intended to shut down its three nuclear plants within the next three years.

Akron-based FirstEnergy supplies electricity to about 6 million customers in Ohio, Pennsylvania, New Jersey, West Virginia, Maryland and New York.

EPA moves to cut auto mileage rules

The Trump administration announced that that fuel-efficiency regulations for cars and light trucks are too stringent and must be revised, formally beginning a process sought by the U.S. auto industry to roll back anti-pollution targets.

The EPA also said it was considering whether to revoke the waiver that allows California to set its own emissions requirements that exceed the federal standards.

The greenhouse gas emission standards that were a signature element of President Barack Obama's climate-change policy are too aggressive, U.S. Environmental Protection Agency chief Scott Pruitt said in a statement Monday outlining the decision.

"The Obama EPA's determination was wrong," Pruitt said in a news release. "Obama's EPA cut the midterm evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality and set the standards too high."

Pruitt's so-called final determination, announced by the agency on Monday, is a step needed to dial back the Obama-era rules, which aimed to slash carbon emissions from cars and light trucks by boosting fuel economy to a fleet average of more than 50 miles per gallon by 2025.

That standard is equivalent to roughly 36 mpg in real-world driving.

In the statement, Pruitt said the agency would begin drafting fresh auto standards for 2022-2025 alongside the National Highway Traffic Safety Administration.

The widely anticipated action drew criticism from consumer and environmental groups ahead of its release. It dovetails with other steps to unwind actions aimed at combating climate change, such as President Donald Trump's withdrawal from the Paris climate accord and the EPA's repeal of a rule slashing carbon emissions from power plants.

The EPA's announcement echoed criticisms expressed by automakers, saying the Obama administration short-circuited the

process and rushed out the final determination just days before leaving office.

The decision also puts the Trump administration's tenuous relationship with California officials on an even rockier path.

The state has its own car and truck efficiency standards aligned with the Obama-era targets, made through an agreement reached in 2011 with the support of nearly all major automakers.

"The California waiver is still being reexamined by EPA under Administrator Pruitt's leadership," the agency said. California has been writing its own clean-air rules since 1970, as part of the state's bid to crack down on smog.

Bitcoin researchers see overvaluation

Given Bitcoin's meteoric rise in 2017, and persistent slump this year, it's easy to wonder just how much the digital currency is really worth.

Researchers at ETH Zurich say they may have found an answer: Bitcoin's value is based on the network of people who use it. And they suspect that the currency is overvalued.

Drawing on a modified version of a model that assigns networks a value proportional to the square of the number of active users, and an equation that can capture how speculative bubbles evolve and grow, researchers at the Swiss university were able to observe how the cryptocurrency's value rises with participation.

Additionally, by pulling from past data, the researchers say they can now better track and spot potential future crashes. On at least four occasions — one each in 2011, 2012 and 2013 plus the most recent at the end of 2017 — the model had determined a fundamental value was heavily exceeded by bubbles that grew and burst.

Their analysis "indicates current support levels for the Bitcoin market in the range of \$22—\$44 billion, at least four times less than the current level," the researchers said, according to a March 29 MIT Technology Review article.

EPA to revoke Obama's 50 mpg rule for vehicles

04/02/2018

Chicago Tribune

Environmental Protection Agency Administrator Scott Pruitt announced Monday that he would revoke Obama-era standards requiring that cars and light trucks sold in the U.S. average more than 50 mpg by 2025, a move that could change the composition of the nation's auto fleet for years to come.

The push to rewrite the first-ever carbon limits on cars and SUVs, which came out of an agreement among federal officials, automakers and the state of California, is sure to spark a major political and legal battle.

California has authority under the Clean Air Act to set its own emissions limits, and it has threatened to sue if it is blocked from imposing stricter targets. Such a fight has broad implications because 12 other states, representing more than a third of the country's auto market, follow California's standards.

Pruitt's decision reflects the power of the auto industry, which asked him to revisit the Obama administration's "midterm evaluation" review of the model years 2022-2025 fuel-efficiency targets just days after he took office. President Donald Trump told autoworkers in Detroit last year that he was determined to roll back the emissions rules as part of a bigger effort to jump-start the nation's car industry.

"The Obama administration's determination was wrong," Pruitt said in a statement. "Obama's EPA cut the Midterm Evaluation process short with politically charged expediency, made assumptions about the standards that didn't comport with reality, and set the standards too high."

Gloria Bergquist, a vice president at the Alliance of Automobile Manufacturers, said in a statement that her members "support the administration for pursuing a data-driven effort and a single national program as it works to finalize future standards. We appreciate that the Administration is working to find a way to both increase fuel economy standards and keep new vehicles affordable to more Americans.

Pruitt did not specify what limits would be put in place, saying the EPA and the National Highway Traffic Safety Administration would establish a national standard that "allows auto manufacturers to make cars that people both want and can afford."

California officials wasted no time Monday in excoriating the decision.

"This is a politically motivated effort to weaken clean vehicle standards with no documentation, evidence or law to back up that decision," Mary Nichols, head of the California Air Resources Board, said in a statement. She argued that the move would "demolish" the nation's shift toward cleaner cars and that "EPA's action, if implemented, will worsen people's health with degraded air quality and undermine regulatory certainty for automakers."

Nichols also hinted at the potential legal fight to come.

"This decision takes the U.S. auto industry backward, and we will vigorously defend the existing clean vehicle standards and fight to preserve one national clean vehicle program," she said, adding that the EPA's decision "changes nothing in California and the 12 other states with clean-car rules that reduce emissions and improve gas mileage -- those rules remain in place."

Also on Monday, the Trump administration sued California to reverse a state law that seeks to handcuff the federal government from selling any of the 45.8 million acres of property it controls in the state.

The Justice Department lawsuit, filed in Sacramento, is the latest federal effort to roll back California's strict environmental protections as the Trump administration seeks to open more land in the West for mining, drilling and other interests.

At issue in the latest lawsuit is a California law that gives a state lands commission the power to block the sale, donation or exchange of federal lands. It was passed in October after Interior Secretary Ryan Zinke announced plans to cut protections for 10 national monuments in the state.

"The Constitution empowers the federal government -- not state legislatures -- to decide when and how federal lands are sold," Attorney General Jeff Sessions said Monday. ct18 0078 180403 N S 0000000000 00004371

Major U.S. Businesses Call out EPA for Expected Rollbacks to Vehicle Emissions Standards

04/02/2018

FinancialWire

As leaders from states across the nation denounce reports of U.S. Environmental Protection Agency (EPA) Administrator Scott Pruitt's final determination that would lead to a significant rollback of the nation's greenhouse gas emissions standards for vehicles, the Ceres senior director of policy and the BICEP Network, Anne Kelly, issued the following statement.

"The EPA's decision will harm state economies across the nation, pushing up fuel costs for employers and consumers and making the U.S. automotive industry less competitive in the global marketplace. This decision will also increase air pollution, which will raise healthcare costs and lead to less productivity as a result of more missed work and school days. The businesses that drive the American economy need cars and trucks that run on less gas, a healthy workforce, and consumers with more money in their pockets to spend on local goods and services. We believe that a strong and consistent national standard is essential to ensuring key economic and environmental benefits, and we would oppose any attempts to undermine states' rights to realize those benefits." The Ceres BICEP Network represents over 45 major U.S. employers, including General Mills, Adobe, Nike, and Mars, Inc. with a combined annual revenue topping \$ 400 billion. In a letter to Administrator Pruitt, the BICEP Network urged the EPA to maintain the standards, which provide a critical opportunity to strengthen the U.S. economy, grow the job market, and enhance the competitiveness of the auto industry.###Ceres is a sustainability nonprofit organization working with the most influential investors and companies to build leadership and drive solutions throughout the economy. The Ceres BICEP Network comprises influential companies advocating for stronger climate and clean energy policies at the state and federal level in the U.S. For more information, visit www.ceres.org and follow [@CeresNews](https://twitter.com/CeresNews). CEI Commends EPA for Reviewing CAFE Rules

04/01/2018

US Official News

Washington: Competitive Enterprise Institute has issued the following news release: Today, the Environmental Protection Agency (EPA) released the result of its mid-term evaluation. As a result of the EPA's review and analysis, EPA Administrator Scott Pruitt announced the current greenhouse-gas emission standards for light-duty vehicles for model year 2022-2025 are not appropriate and should be revised.

The Competitive Enterprise Institute (CEI) commends Administrator Pruitt for taking this step forward to ensure the future of automobiles will be cars that are safe, affordable, and what consumers want to buy. CEI has followed the CAFE issue for decades, which includes a major court victory in 1992 regarding CAFE's lethal effects. CEI experts said the following about today's announcement. CEI General Counsel Sam Kazman on CAFE's mandates and safety: CAFE's lethal effects on vehicle crashworthiness were documented by analysts and a federal appeals court years ago. Despite this, CAFE has remained in force, getting even more stringent and more deadly over the years. We hope that the Trump Administration will finally take account of those effects and start to liberalize this program. Director of CEI's Center for Energy and Environment Myron Ebell on CAFE's impact on consumer choice: EPA's announcement is good news for consumers who care about safety, performance, and size, as well as fuel economy in the vehicles they drive. This is the first step in many years toward reducing government control over what kinds of cars people can choose to buy. CEI Senior Fellow Marlo Lewis on CAFE's costs and impact on climate: Fuel economy mandates restrict consumer choice, add thousands of dollars to the cost of new vehicles, and limit vehicle safety. Contrary to the program's original rationale, the world is not running out of oil. And even if you worry about global warming, fuel efficiency standards are a stupendously inefficient climate change mitigation strategy. Congress should end the reign of bureaucrats and put consumers back in charge of telling automakers what kinds of cars and trucks to produce.

Washington: Senator Markey Blasts EPA on Moving Forward with Roll Back of Fuel Economy Emissions Standards

03/30/2018

US Official News

Washington: Office of the Senator Ed Markey has issued the following news release: Senator Edward J. Markey (D-Mass.), a member of the Environment and Public Works Committee and Chair of the Senate Climate Task Force, released the following statement after reports that the Environmental Protection Agency (EPA) has sent a draft of a so-called final determination that would relax standards requiring automakers to reduce emissions for model year 2022-2025 cars and light trucks to the White House. The EPA is required to complete a new final determination by April 1 after reopening the process. The Obama administration's historic 54.5 mpg standard was partially enabled by the Energy Independence and Security Act of 2007, which included fuel economy standards co-authored by Senator Markey when he was in the House of Representatives.

"The historic fuel economy emissions standards on the books save consumers money at the pump and protect our national security by reducing our reliance on foreign oil. These standards are also the most important action the United States has taken to fight climate change," said Senator Markey. "Rolling back these standards would be a declaration of war on American consumers and the planet. The Trump administration should immediately abandon its efforts to make a U-turn on these critical standards that benefit consumers, our country and our planet." In December 2017, Senator Markey, Sheldon Whitehouse (D-R.I.), and Kamala Harris (D-Calif.) led a group of 24 Senators in calling on the EPA to not weaken light-duty vehicle emissions standards for model 2022-2025 and strenuously objecting to revisiting emissions standards for model year 2021, which were never supposed to be part of the EPA's midterm evaluation. These standards are projected to save nearly 2.5 million barrels of oil a day by 2030 – nearly as much oil as we currently import from OPEC, save consumers over \$1 trillion and reduce global warming pollution by 6 billion metric tons. Since reaching an historic agreement with the Obama administration and state leaders, the auto industry has gone from the brink of economic disaster to record auto sales in 2015 and 2016, including adding 700,000 U.S. jobs.
